Notes:

* Calculated values using a hardness of 175 mg/L

** Ammonia values determined using a pH of 8.4 and a temperature of 30 deg. C.

^a Criteria was evaluated from Isleta, Sandia, Santa Clara and San Juan Pueblos

¹ Dissolved mercury was calculated by multiplying total mercury concentrations by the Federal Standard conversion factor of 0.85

² Acute value applies to methyl parathion only; chronic value applies to sum of parathion and methyl parathion.

-- = no value

ACR = Acute to chronic ratio

FHM = Fathead minnow

NA = Not available

RGSM = Rio Grande Silvery Minnow

Notes:

Yellow highlighted parameters were not considered as toxics in this evaluation and thus are not reflected in subsequent counts of detects, non-detects, etc.

If a parameter was measured as greater than detection, but not in all analyses, then 1/2 of the MDL was used for subsequent non-detected values for a parameter.

If a parameter was measured as less than detection for all of its respective analyses, the parameter was considered not present.

MDL = Method detection limit

PEC = Probable effects concentration

TEC = Threshold effects concentration

Dry weight = (wet weight conc)/(1-(%moisture/100)). % moisture was assumed to be 80%

FHM = Fathead minnow

LER = Lowest effect residue

MDL = Method detection limit

NER = No effects residue
