12.7. WATER QUALITY

12.7.1. Introduction

Regional water planning in its simplest terms is to determine how to balance future demands given today's supply. Water quality is not an obvious factor in the equation. However, quantity and quality are intertwined. The Interstate Stream Commission's *Regional Water Planning Handbook* calls for water quality issues to be included in the regional plans, including an assessment of the quality of water sources and an identification of sources of contamination. The <u>State Water Plan</u> calls for an inventory of the quantity and quality of the state's water resources, population projections and other water resource demands under a range of conditions (Section C-3).

Policy Statements - The State of New Mexico shall coordinate and expand on existing efforts by its various agencies and institutions to collect, integrate, and disseminate data regarding current and future water supply, water uses, and water quality to facilitate informed and responsible decision-making. (2003 State Water Plan, adopted by the New Mexico Interstate Stream Commission on December 17, 2003)

Water quality refers to the physical, chemical, and biological characteristics of water. Attributes that describe the quality of water include levels of sediment, nutrients, heavy metals, toxic chemicals, pesticides, radioactivity, temperature, dissolved oxygen, and disease-causing organisms. Different uses have different requirements with regard to these attributes. What is an acceptable level of water quality for irrigation may not be an acceptable level of quality for drinking water, and what is an acceptable level of quality for livestock watering may not be an acceptable level of quality for a coldwater fishery. Specific standards for each use are set by the federal government, state, and tribes. For each use, the quality of the water that is available directly affects the supply that is effectively available. ("Water Resource Assessment, Part B - Water Quality", Region 6 Water Plan, epcog.org/nw/pdf/region6water/quality.pdf (accessed March 23, 2004))

Assurance of availability to meet future water demands requires both a sufficient quantity of water and water that is of sufficient quality for the intended use. Contaminants impacting surface water or groundwater quality may impair the use of available water resources. ... Water quality issues place constraints on the water

¹ The *Handbook* goes on to call for an assessment of the feasibility of water quality management plans (improving water and land-use practices, water treatment alternatives, and wastewater treatment). Source and quality of future water supply including i.) cost effectiveness, technical feasibility, and social and political issues of using the identified future water source, and ii.) potential for water supply contamination are to be evaluated. Finally, legal Issues --such as Federal, State, Municipal, Tribal or pueblo water quality standards-- are to be reviewed. Phase III will hopefully alleviate those deficiencies currently existing in this report.

available to the MRG planning region in two ways: (1) contaminant impacts on water supplies and (2) naturally occurring water quality constraints. Contaminant impacts clearly render a portion of the region's water unsuitable for use and require extensive remediation efforts. ("Assessment of Regional Water Quality Issues and Impacts to the Water Supply," Middle Rio Grande Plan, http://www.waterassembly.org/pdfs2/WtrQualRpt 206.pdf (accessed March 23, 2004))

Water quality issues are moving to the forefront in both federal and state forums as a new constraint on all water supplies. A stream's water *quality* often is affected by the *quantity* of water in the stream, and new regulations may require that water remain in a stream in order to meet a water quality standard. Both federal and state water quality regulations, therefore, could easily affect the quantity of water available for use. ("Section 6.3 – Water Quality Legal Issues," San Juan Basin Regional Water Plan, October 4, 2003, http://www.seo.state.nm.us/water-info/NMWaterPlanning/regions/SanJuan/10-04-03Section06LegalIssue.pdf, (accessed March 23, 2004))

Water quality is a significant consideration in the region's water supply. The available groundwater may be compromised by contamination, either human caused or natural. The available water should be protected from potential contamination from the impacts of human activities or natural events. ... The NMED has expressed concern that non-point sources of pollution in New Mexico may constitute one of the more serious water quality problems facing the state (NMWQCC, 2000b). Non-point pollution is diffuse in origin, the result of rain or snowmelt carrying pollutants from the land into streams, lake, and rivers. The principal contaminants contributed from this type of pollutant source are nutrients, sediments, toxic substances, organic matter, salts, metals, and petroleum and its byproducts. The NMED estimates that about 92 percent of known river water quality impairment in the state is due to nonpoint sources (NMWQCC, 2000b). The occurrence of significant agriculture activity and urbanization within the Jemez y Sangre planning region makes it likely that some surface water quality degradation is attributed to this type of source. Jemez y Sangre Regional Water Plan, March 2003, www.seo.state.nm.us/water-info/ NMWaterPlanning/regions/jemezysangre/jys apndxa.pdf (accessed March 23, 2004))

Set out in this section is general information about the Clean Water Act and Total Maximum Daily Loads (TMDLs), and specific available information with respect to the two watersheds. More information can be found in the appendices.

Water quality monitoring and protection is the primary responsibility of the United States Environment Protection Agency (EPA) and the New Mexico Environment Department (NMED). The New Mexico Environment Department (NMED) maintains a number of sources of water quality data for both ground and surface water. EPA and the U.S. Geological Survey (USGS) also maintain long-term databases of water quality measurements.

Water quality information for the subregion was assessed through existing documents and databases, all last accessed on March 23, 2004. Specific reference was made to:

- * "Assessment of Regional Water Quality Issues and Impacts to the Water Supply," (http://www.waterassembly.org/pdfs2/Wtr QualRpt_206.pdf), being the study prepared for the Middle Río Grande Regional Water Plan by D.B. Stephens & Associates in February 2003;
- * <u>Jemez Watershed TMDLs</u> report prepared by NMED Surface Water Quality Bureau in 2002, http://www.nmenv.state.nm.us/swqb/Jemez Watershed TMDLs/Index.html;
- * Water Quality and Water Pollution Control in New Mexico 2000 prepared by the N.M. Water Quality Control Commission, which is required to submit this biennial report to U.S. Congress pursuant to section 305.b of the federal Clean Water Act http://www.nmenv.state.nm.us/swqb/305b 2000.html;
- * "State Of New Mexico Water Quality Standards For Interstate And Intrastate Surface Waters 20.6.4 NMAC As amended through October 11, 2002," http://www.nmenv.state.nm.us/NMED regs/swqb/20 6 4 nmac.html; and
- * 2002-2004 State of New Mexico 303(d) List, published by the Surface Water Quality Bureau, New Mexico Environment Department, (June 2003), www.nmenv.state.nm.us/swqb/2000-2002_New_Mexico_303d_List.pdf.
- * Water Resources Data New Mexico, Water Year 2002, Water-Data Report NM-02-1, U.S. Deportment of the Interior, U.S. Geological Survey, Prepared in cooperation with the State of New Mexico and with other agencies http://nm.water.usgs.gov/nm2002wrdreport.pdf

Further information regarding groundwater quality and information on specific sites and facilities that may have the potential to impact surface water or groundwater quality was obtained from various NMED databases.

12.7.2. General Information

The 1972 Water Pollution Control Act (33 U.S.C. §§ 1251 et seq.), commonly called the Clean Water Act (CWA), is the primary federal law responsible for limiting pollution in U.S. waters. The law includes provisions for standards and financial assistance to address water pollution of all types with the objective of improving water quality in impaired areas.

A good synopsis of the Clean Water Act and Total Maximum Daily Loads can be found in a technical report published by New Mexico State University, "The Clean Water Act and Total Maximum Daily Loads in New Mexico: Frequently Asked Questions," Technical Report 39, June 2002. Relevant sections are set out below, omitting citations, with the fuller report included in the Appendix:

The 1972 Water Pollution Control Act (33 U.S.C. §§ 1251 et seq.), commonly called the Clean Water Act (CWA), is the primary federal law responsible for limiting pollution in U.S. waters. The law includes provisions for standards and financial

assistance to address water pollution of all types with the objective of improving water quality in impaired areas.

A permit system is the principal mechanism used by the Clean Water Act to reach its objective of reducing and eventually eliminating water pollution. Anyone engaged in point-source polluting activities is required to obtain a permit from the USEPA. The permit contains detailed limitations on the amount and type of pollutants that may be discharged. It also details the manner in which those pollutants will be discharged. This permitting system is called the National Pollutant Discharge Elimination System (NPDES).²

The Clean Water Act also required states to establish total maximum daily loads (TMDLs) for pollutants in their waters. States were directed to develop best available technology standards for each industry. In addition, the act required an upgrade of municipal wastewater facilities from primary to secondary treatment, created a national pretreatment program and authorized grants for municipal wastewater treatment infrastructure.

TMDLs set the maximum amount of pollution from all sources that a water body can receive without violating water quality standards. In practice, a TMDL is a planning document that establishes a budget for types of water contaminants by source. A TMDL also develops water quality management strategies.

Point-source pollution occurs at identifiable discharge points, such as at a factory. Nonpoint-source pollution is pollution that cannot be traced to the end of an outlet, such as runoff from forest logging, sheet flows from pastures or movement of soil and fertilizer from cropped lands into waterways. Nonpoint-source pollution is much more difficult to deal with than point-source pollution for several reasons. The exact source is impossible to establish.

The §303(d) list is named for the Clean Water Act section that requires each state to identify surface waters within its boundaries that are not meeting or not expected to meet water quality standards (NMED, 2000). TMDL development and implementation has been underway in New Mexico since 1998. A list of water quality limited segments having or needing TMDLs is available online. Completed TMDLs in the state also are available online, as are TMDL delistings for the state.

The NMWQC issues New Mexico interstate and intrastate water quality standards. These standards specify designated uses for the waters, which include warm-water

epcog.org/nw/pdf/region6water/quality.pdf (accessed March 23, 2004))

² Under section 402 of the federal Clean Water Act (33 U.S.C. § 1342 (2003)), any discharges by point sources, except in compliance with the limitations imposed in a National Pollutant Discharge Elimination System ("NPDES") permit, are declared unlawful. In New Mexico, the NPDES permit program is the primary mechanism for controlling point source discharges to surface waters. EPA Region 6 in Dallas issues permits that specify the amount and concentrations of contaminants that a permittee can discharge into a surface water. EPA also enforces permit effluent limitations. In addition, pursuant to section 401 of the Clean Water Act and section 74-6-5(E) of the New Mexico Water Quality Act, the New Mexico. "Legal Issues," Region 6 Water Plan,

and cold-water fisheries, livestock watering, wildlife habitat, fish culture, irrigation water storage, irrigation, primary and secondary contact, domestic water supply, and municipal and industrial water supply. Primary contact includes recreational uses, such as swimming and water skiing, in which a human has prolonged and intimate contact with water. Secondary contact refers to recreational uses, such as fishing, wading, and boating. A water body is considered impaired or polluted if the existing water quality is not sufficiently high to support the designated use. In designating uses for a water body, states and tribes examine the suitability of a water body for the uses based on its physical, chemical and biological characteristics. Other factors that must be taken into account include a water body's geographic setting, scenic qualities, as well as the socioeconomic and cultural characteristics of the surrounding area.

Water quality standards in New Mexico include general standards, use designation for specific water bodies and the subsequent standards related to use. Contaminants affecting designated uses in New Mexico include stream bottom deposits, temperature, turbidity, fecal coliform, phosphorus, ammonia and aluminum. New Mexico interstate and intrastate standards for these and other contaminants are available from the NMWQCC and the Internet.

Based on extensive monitoring and sampling, TMDLs were established by the New Mexico Environment Department's Surface Water Quality Bureau. These are the amounts of pollutants that may be discharged into the affected streams without exceeding water quality standards.

Plans to implement these TMDLs focus on a combination of best management practices to control sediment. Best management practices listed in the TMDL document may include riparian restoration. Good range management is encouraged along the river reaches. Culvert repair and maintenance, erosion control, stream bank stabilization, and improved road maintenance might be listed in the final TMDL document as practices that will be promoted by the Surface Water Quality Bureau. Federal funding is made available through provisions of the Clean Water Act.

Table 12.7-1 sets out the drinking water standards determined by both New Mexico and EPA for surface water. Table 12.7-2 lists the drinking water standards set by both the State of New Mexico and the EPA for groundwater. The state criteria consist of drinking water standards published by the NMED Ground Water Quality Bureau. As with surface water standards, EPA's standards comprise Maximum Contaminant Levels (MCLs), Secondary Drinking Water Regulations (SDWRs), and Action Levels (ALs). There is a proposal to amend these standards. (see www.nmenv.state.nm.us/swqb/Standards/Rev Statemnt of Basis 10 1 03.pdf).

Table 12.7-1 New Mexico Drinking Water Standards for Surface Water and EPA

Drinking Water Standards

Constituent	New Mexico Surface Water Standard	EPA Drinking Water Standard
рН	6-9	6.5-8.5 ^a
Total Dissolved Solids (TDS)		500 mg/L ^b
Aluminum (Al)		0.05 mg/L ^a
Arsenic (As)	0.05 mg/L	0.05 mg/L $^{\rm b}$, 0.01 mg/L $^{\rm c}$
Barium (Ba)	2.0 mg/L	2 mg/L ^b
Chloride (Cl)		250 ^a
Cyanide (CN)	0.2 mg/L	$0.2 \text{ mg/L}^{\text{ b}}$
Fluoride (Fl)		2 ^a
Iron (Fe)	1.0 mg/L	$0.3 \text{ mg/L}^{\text{ a}}$
Lead (Pb)	0.05 mg/L	0.015 mg/L ^d
Manganese (Mn)		0.05 ^a
Nickel (Ni)	0.1 mg/L	
Nitrate as Nitrogen (NO3 as N)		10 mg/L ^b
Selenium (Se)	0.05 mg/L	0.05 mg/L ^b
Silver (Ag)		0.1 ^a
Strontium (Sr)	8 pCi/L	
Sulfate (SO ₄)		250 mg/L ^a
Tritium (H ₃)	20,000 pCi/L	
Uranium (U)	5 mg/L	$0.02~{ m mg/L}^{ m c}$

Groundwater From Jemez y Sangre Regional Water Plan

Ground water typically originates as precipitation that infiltrates through soil and rock into the ground water system. As water flows from recharge areas into the aquifer its chemistry is changed. In general, water quality decreases with time and distance as ground water flows from recharge areas to discharge areas. These changes in quality are a function of the solubility of mineral matter along the flow path and the length of time the ground water is in contact with soluble minerals.

Water may also mix with water of inferior quality. As ground water is withdrawn from bedrock aquifers at rates greater than the rate of recharge, older water or water of inferior quality migrates toward the areas of withdrawal. In most cases, the greater the withdrawal, the more rapid the migration of poor quality ground water towards the pumping centers and the greater the deterioration of the resource. Therefore, the volume of potable ground water in bedrock aquifers is limited, and nonrenewable when withdrawal exceeds recharge.

Table 12.7-2 New Mexico Drinking Water Standards for Groundwater and EPA

Drinking Water Standards

Constituent	New Mexico Surface Water Standard	EPA Drinking Water Standard
рН	6-9	6.5-8.5 ^a
Total Dissolved Solids (TDS)	1,000 mg/L	$500 \text{ mg/L}^{\text{ b}}$

a EPA Secondary Drinking Water Regulation (SDWR) – a non-enforceable health goal which is set at a level at which no known or anticipated adverse effect on the health of persons occur and which allows an adequate margin of safety.

b EPA Maximum Contaminant Level (MCL) – the highest level of a contaminant that is allowed in drinking water. MCLs are enforceable.

c Proposed MCL.

d EPA Action Level (AL) – the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow. For lead it is the level which, if exceeded in over 10% of the homes tested, triggers treatment.

EPA = U.S. Environmental Protection Agency

mg/L = Milligrams per liter

pCi/L = Picocuries per liter

--- = Not applicable

In addition, groundwater may be degraded through migration of contaminants from human activities. Potential sources of contamination are generally concentrated in urban, agricultural, and mining areas, and include industrial wastewater, municipal sewage, oil-field brines, drainage from farms, mining effluent, petroleum-handling facilities, leakage from underground storage tanks, and accidental spills.

The effects of human activity may not be immediately apparent, but as large withdrawals

from an aquifer cause water to migrate toward the pumping center, substances from chemical leaks or spills may eventually reach wells.

Seepage from septic tanks, which can affect groundwater and surface water, is also of increasing concern as the population of the region expands. In the state of New Mexico, over half of all cases of ground water contamination have been shown to be caused by nonpoint sources, particularly household septic tanks and cesspools (NMWCC, 1994).

Groundwater basins in this plan are classified based on the State Engineer's system of administrative basins. Although the authority of the State Engineer does not extend to tribes and Pueblos, information on tribal and Pueblo water quality is included with the discussion of administrative basins.

12.7.3. Issues Specific To The Subregional Planning Region

Efforts are underway in both watersheds of the subregion to address water quality. In the Río Jemez, a Total Maximum Daily Load Report has been prepared, listing nine individual reaches which need to address seven separate TMDL issues. These TMDLs are also set forth in the 2002-2004 State of New Mexico 303(d) List, as are those for the Río Puerco. While extensive testing was done in the Río Jemez in 1998, which led to the TMDL Report, the Río Puerco information has yet to be updated. In early 2004, NMED initiated an effort to assist Río Jemez residents with creating management plans to address the TMDLs mentioned in the report. Concurrently, NMED is also initiating an effort to update the information in the Río Puerco as a prelude to establishing management plans. The Río Puerco has developed a Watershed Restoration Action Strategy (WRAS), which reads in part as follows:

SECTION 3 - DEFINING SPECIFIC WATER QUALITY PROBLEMS

The Río Puerco Watershed, defined under the United States Geological Survey Hydrologic Unit Codes 130204-130207, is divided into two primary stream segments by the current version of the New Mexico Water Quality Control Commission's (WQCC's) "State of New Mexico Standards for Interstate and Intrastate Streams" (October 2000). Segment #2-107, the perennial reach and tributaries to the Upper Main Stern (UMS) of the Río Puerco gather headwaters from the western edge of the Nacimiento Mountains (see attached maps). Segment #2-107 also includes the Río San Jose, on the western side of the watershed, with tributaries emanating from the San Mateo and Zuni Mountains. In addition, the state-listed area includes segment #2-105, the intermittent or ephemeral flow (generally the central and southern areas of the watershed) below the perennial reaches of the Río Puerco, which enters the main stem of the Rio Grande.

Several reaches of the Río Puerco and its tributaries are listed as impaired, that is, they fail to fully meet the stream's designated uses. These are defined in *Water Quality and Water Pollution Control in New Mexico*, Appendix B - the State's 305(b) Report (2000), end in the 2000-2002 State of New Mexico CWA Section 303-D List for Assessed Stream and River Reaches. These documents list non-attained uses for individual perennial to intermittent reaches including the Río Puerco, Nacimiento Creek, Río San Jose, La Jara Creek, San Pablo Creek, Rito Leche, Rito de Los Pinos, Bluewater Creek, Río Paguate, and Río Moquino. Current designated uses for coldwater fishery, and a select reach designated as a high quality

coldwater fishery, are listed under categories ranging from "impacts observed" to "partially supporting" to "nonsupport." The Río San Jose's listed reach has a drinking water source (DWS) designation, and tributaries to the Río Puerco UMS are known to provide water for irrigation purposes. The monitored or evaluated impairments of concern include temperature exceedances, stream bottom deposits, plant nutrients, metals, turbidity, dissolved oxygen, and pH. These effects are largely due to a lack of vegetative density end diversity in a region of high erosion potential and impacts resulting from habitat alteration, agriculture, rangeland impacts, resource extraction, reduction of riparian vegetation, streambank destabilization, and road maintenance activities. The total effected stream reach is listed at 223.1 miles (359 kilometers) in state documents, but the UWA prioritization listing is currently focused on a total of 110 stream miles (191.5 km).

The region has historically been used for agriculture, grazing, logging, mining, and a wide range of recreational purposes, and though relatively sparsely populated, the encroachment of urban development is increasing. Presently, agriculture is the dominant watershed-wide activity. The specific causes of watershed decline result from the combination of these land uses and their impact on a relatively vulnerable landscape. The listed causes are reflected in the RPMC's stated watershed restoration priorities, and they essentially define the general targets for improvement that this WRAS is pursuing. Specific sites for project implementation (within certain prioritized subwatersheds, as described below) are still being identified. (RPMC WRAS, May 31, 2001)

Stream standards have been incorporated into the New Mexico Administrative Code as State Of New Mexico Standards For Interstate And Intrastate Surface Waters. They are found at 20.6.4 NMAC, as amended through October 11, 2002. The relevant standards are set out below, with further information contained in the appendices.

20.6.4.105 RIO GRANDE BASIN - The main stem of the Rio Grande from the headwaters of Elephant Butte reservoir upstream to Alameda bridge (Corrales bridge), the Jemez river from the Jemez pueblo boundary upstream to the Río Guadalupe, and intermittent flow below the perennial reaches of the Río Puerco and Río Jemez which enters the main stem of the Rio Grande.

- A. Designated Uses: irrigation, limited warmwater fishery, livestock watering, wildlife habitat, and secondary contact.
- B. Standards:
 - (1) In any single sample: pH shall be within the range of 6.6 to 9.0, and temperature shall not exceed 32.2°C (90°F). The use-specific numeric standards set forth in 20.6.4.900 NMAC are applicable to the designated uses listed above in Subsection A of this section.
 - (2) The monthly geometric mean of fecal coliform bacteria shall not exceed 1,000/100 mL; no single sample shall exceed 2,000/100 mL (see Subsection B of 20.6.4.13 NMAC).
 - (3) At mean monthly flows above 100 cfs, the monthly average concentration for: TDS shall not exceed 1,500 mg/L, sulfate shall not exceed 500 mg/L, and chloride shall not exceed 250 mg/L.

[20.6.4.105 NMAC – Rp 20 NMAC 6.1.2105, 10-12-00]

20.6.4.107 RIO GRANDE BASIN - The Jemez river from its confluence with the Rio Guadalupe upstream to state highway 4 near the town of Jemez Springs and perennial reaches of Vallecito creek.

- A. Designated Uses: coldwater fishery, primary contact, irrigation, livestock watering, and wildlife habitat.
- B. Standards:
 - (1) In any single sample: temperature shall not exceed 25°C (77°F), pH shall be within the range of 6.6 to 8.8, and turbidity shall not exceed 25 NTU. The use-specific numeric standards set forth in 20.6.4.900 NMAC are applicable to the designated uses listed above in Subsection A of this section.

(2) The monthly geometric mean of fecal coliform bacteria shall not exceed 200/100 mL; no single sample shall exceed 400/100 mL (see Subsection B of 20.6.4.13 NMAC). [20.6.4.107 NMAC – Rp 20 NMAC 6.1.2105.5, 10-12-00]

20.6.4.108 RIO GRANDE BASIN - The Jemez river and all its tributaries above state highway 4 near the town of Jemez Springs, and the Guadalupe river and all its tributaries.

- A. Designated Uses: domestic water supply, fish culture, high quality coldwater fishery, irrigation, livestock watering, wildlife habitat, and secondary contact.
- B. Standards:
 - (1) In any single sample: conductivity shall not exceed 400 μ mhos, pH shall be within the range of 6.6 to 8.8, temperature shall not exceed 20°C (68°F), and turbidity shall not exceed 25 NTU. The use-specific numeric standards set forth in 20.6.4.900 NMAC are applicable to the designated uses listed above in Subsection A of this section.
- (2) The monthly geometric mean of fecal coliform bacteria shall not exceed 100/100 mL; no single sample shall exceed 200/100 mL (see Subsection B of 20.6.4.13 NMAC). [20.6.4.108 NMAC Rp 20 NMAC 6.1.2106, 10-12-00]

20.6.4.109 RIO GRANDE BASIN - Perennial reaches of Bluewater creek, Rio Moquino, Seboyeta creek, Rio Paguate, the Rio Puerco within the Santa Fe national forest, and all other perennial reaches of tributaries to the Rio Puerco including the Rio San Jose in Cibola county from the USGS gaging station at Correo upstream to Horace springs.

- A. Designated Uses: coldwater fishery, domestic water supply, fish culture, irrigation, livestock watering, wildlife habitat, and primary contact.
- B. Standards:
 - (1) In any single sample: pH shall be within the range of 6.6 to 8.8, temperature shall not exceed 20°C (68°F), total phosphorus (as P) shall not exceed 0.1 mg/L, and turbidity shall not exceed 25 NTU. The use-specific numeric standards set forth in 20.6.4.900 NMAC are applicable to the designated uses listed above in Subsection A of this section.
- (2) The monthly geometric mean of fecal coliform bacteria shall not exceed 100/100 mL; no single sample shall exceed 200/100 mL (see Subsection B of 20.6.4.13 NMAC). [20.6.4.109 NMAC Rp 20 NMAC 6.1.2107, 10-12-00]

According to the <u>Jemez Watershed TMDLs report</u>, <www.nmenv.state.nm.us/swqb/Jemez_Watershed_TMDLs/Index.html> (accessed March 23, 2004), the following reaches require water management plans to address the mentioned water quality issues::

- Clear Creek: Turbidity & Total Organic Carbon;
- East Fork of the Jemez River: Turbidity;
- Jemez River: Metals (Chronic aluminum);
- Lower Río Cebolla: Stream Bottom Deposits;
- Redondo Creek: Temperature & Turbidity;
- Río de las Vacas: Temperature & Total Organic Carbon;
- Río Guadalupe: Metals (Chronic aluminum);
- Rito Peñas Negras: Stream Bottom Deposits, Temperature & Total Organic Carbon;
- San Antonio Creek: Temperature & Turbidity;
- Sulphur Creek: pH & Conductivity; and
- Upper Río Cebolla: Stream Bottom Deposits & Temperature;

The report further sets out the particular pollutants examined (such as turbidity, stream bottom deposits, temperature, and pH) for each reach and the current TMDL status.

The Approved 2002-2004 State Of New Mexico §303(D) List For Assessed River/Stream Reaches Requiring Total Maximum Daily Loads (TMDLs), published by the New Mexico Environment Department, Surface Water Quality Bureau (June 2003), www.nmenv.state.nm.us/swqb/2000-2002_New_Mexico_303d_List.pdf (accessed March 2004), includes the TMDLs for the Río Jemez and Río Puerco. The following are summaries of the affected stream reaches derived from this report.

12.7.3.1. Río Jemez.

- 1. Calaveras Creek (Río Cebolla to headwaters)
- 2. Clear Creek (Río de las Vacas to San Gregorio Lake)
- 3. Fenton Lake
- 4. Jemez River (East fork)
- 5. Jemez River (HWY 4 near Jemez Springs to East Fork)
- 6. Jemez River (Río Guadalupe to HWY4 nr Jemez Springs)
- 7. Redondo Creek (Sulpher Creek to headwaters)
- 8. Río Cebolla (Fenton Lake to headwaters)
- 9. Río Cebolla (Río de las Vacas to Fenton Lake)
- 10. Río de las Vacas (Río Cebolla to Rito de las Palomas)
- 11. Rio Guadalupe (Jemez River to confl with Río Cebolla)
- 12. Rito Peñas Negras (Río de las Vacas to headwaters)
- 13. San Antonio Creek (East Fork Jemez R to headwaters)
- 14. Sulphur Creek (Redondo Creek to headwaters)

1. Calaveras Creek (Río Cebolla to headwaters)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A 53	9.2	20.6.4.108	4	31-Dec-02 Proposed	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:
Stream Bottom Deposits Moderate

Probable Sources of Impairment:

Highway Maintenance and Runoff

Individual Active NPDES Permits: TMDL (s) Completed:

2. Clear Creek (Río de las Vacas to San Gregorio Lake)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A_54	8.92	20.6.4.108	4	31-Dec-02 Proposed	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate

Probable Sources of Impairment:

Source Unknown Natural Sources

Habitat Modification (other than Hydromodification) Bank or Shoreline Modification/Destabilization

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for turbidity and TOC

3. Fenton Lake Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.B 00	23.81	20.6.4.108	8	31-Dec-17	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Plant Nutrients Moderate
Bottom Deposits Moderate

Probable Sources of Impairment:

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland Onsite Wastewater Systems (Septic Tanks)

Land Disposal

Highway Maintenance and Runoff

Habitat Modification (other than Hydromodification)

Grazing related Sources

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed:

4. Jemez River (East fork)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A 10	19.03	20.6.4.108	4	31-Dec-02	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Partially supporting

Assessment information: Probable Causes of Impairment: Magnitude: Turbidity Moderate

Probable Sources of Impairment:

Silviculture

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland Harvesting, Restoration, Residue Management Habitat Modification (other than Hydromodification)

Grazing related Sources

Bank or Shoreline Modification/Destabilization

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for turbidity

5. Jemez River (HWY 4 near Jemez Springs to East Fork)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A_00	3.4	20.6.4.108	1	31-Dec-02	No

Impaired Designated Use (s):Attainment status:livestock wateringPartially supportinghigh quality coldwater fisheryPartially supportingfish culturePartially supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate
Stream Bottom Deposits Moderate
Aluminum - acute Moderate

Probable Sources of Impairment:

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland

Natural Sources
Land Development

Highway Maintenance and Runoff

Habitat Modification (other than Hydromodification)

Grazing related Sources

Construction

Bank or Shoreline Modification/Destabilization

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for Al acute, turbidity, and SBD; de-list letter for plant nutrients

6. Jemez River (Río Guadalupe to HWY4 nr Jemez Springs)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2105.5_10	9.67	20.6.4.107	1	31-Dec-02	No

Impaired Designated Use (s):Attainment status:livestock wateringPartially supportingcoldwater fisheryPartially supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate
Stream Bottom Deposits Moderate
Aluminum - acute Moderate

Probable Sources of Impairment:

Source Unknown

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland

Natural Sources Land Development

Highway Maintenance and Runoff

Habitat Modification (other than Hydromodification)

Grazing related Sources

Construction

Bank or Shoreline Modification/Destabilization

Agriculture

Individual Active NPDES Permits: Permit No: Permit Facility Name:

NM0028011 Jemez Springs, Village of/WWTP

TMDL (s) Completed: TMDL for Al acute, turbidity, and SBD; de-list letter for plant nutrients

7. Redondo Creek (Sulpher Creek to headwaters)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A_21	6.2	20.6.4.108	4	31-Dec-02	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate
Temperature Moderate

Probable Sources of Impairment:

Road Maintenance and Runoff Removal of Riparian Vegetation

Range grazing - Riparian and/or Upland

Habitat Modification (other than Hydromodification)

Grazing related Sources

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for turbidity, total phosphorus, and temperature; de-list letter for total phosphorus

8. Río Cebolla (Fenton Lake to headwaters)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A_52	14.63	20.6.4.108	2	31-Dec-02	No

Attainment status: Impaired Designated Use (s):

high quality coldwater fishery

Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Temperature Moderate Stream Bottom Deposits Moderate **Probable Sources of Impairment:**

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland Intensive Animal Feeding Operations Highway Maintenance and Runoff

Habitat Modification (other than Hydromodification)

Grazing related Sources

Aquaculture Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for temperature and SBD

9. Río Cebolla (Río de las Vacas to Fenton Lake)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A 50	6.07	20.6.4.108	4	31-Dec-02	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Stream Bottom Deposits Moderate

Probable Sources of Impairment:

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland Highway Maintenance and Runoff

Grazing related Sources

Agriculture

Individual Active NPDES Permits: Permit No: Permit Facility Name:

NM0030112 NMG&FD/Seven Springs Fish Hatchery

TMDL (s) Completed: TMDL for SBD

10. Río de las Vacas (Río Cebolla to Rito de las Palomas)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106.A 40	13.42	20.6.4.108	3	31-Dec-02	No

Impaired Designated Use (s):

high quality coldwater fishery

Not supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Temperature Moderate

Probable Sources of Impairment:

Removal of Riparian Vegetation

Range grazing - Riparian and/or Upland

Habitat Modification (other than Hydromodification)

Grazing related Sources

Bank or Shoreline Modification/Destabilization Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for temperature and TOC

11. Río Guadalupe (Jemez River to confl with Río Cebolla)

Jemez

Assessment ID:	sessment ID: Size (mi or ac): WQS reference:		Priority:	TMDL due:	Federal aquatic T/E species	
NM-2106.A_30	12.65	20.6.4.108	3	31-Dec-02	No	

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Partially supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate
Aluminum - chronic Moderate

Probable Sources of Impairment:

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland

Natural Sources

Habitat Modification (other than Hydromodification)

Grazing related Sources

Bank or Shoreline Modification/Destabilization

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for Al chronic, turbidity, and SBD; de-list letter for total phosphorus

12. Rito Peñas Negras (Río de las Vacas to headwaters)

Jemez

Assessment ID:	Size (mi or ac):	WQS reference:	Priority:	TMDL due:	Federal aquatic T/E species
NM-2106 A 42	11 78	20 6 4 108	4	31-Dec-02	No

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Partially supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Temperature Moderate Stream Bottom Deposits Moderate

Probable Sources of Impairment:

Removal of Riparian Vegetation

Range grazing - Riparian and/or Upland Highway Maintenance and Runoff

Habitat Modification (other than Hydromodification)

Grazing related Sources

Bank or Shoreline Modification/Destabilization

Agriculture

Individual Active NPDES Permits:

TMDL (s) Completed: TMDL for temperature, TOC, and SBD

13. San Antonio Creek (East Fork Jemez R to headwaters)

Jemez

Assessment ID:	Assessment ID: Size (mi or ac):		WQS reference: Priority:		Federal aquatic T/E species	
NM-2106.A_20	24.75	20.6.4.108	4	31-Dec-02	No	

Impaired Designated Use (s): Attainment status: high quality coldwater fishery Partially supporting

Assessment information: Probable Causes of Impairment: Magnitude:

Turbidity Moderate
Temperature Moderate

Probable Sources of Impairment:

Silviculture

Removal of Riparian Vegetation

Recreation and Tourism Activities (other than Boating - see 7900)

Range grazing - Riparian and/or Upland

Natural Sources

Logging Road Construction/Maintenance

Land Development

Habitat Modification (other than Hydromodification)

a = Conclusions concerning attainment of fishery uses are largely based on water quality analysis; where available, biological data was used to verify these results.

Source - Table 15, "Water Quality And Water Pollution Control In New Mexico ~ 2000; A State Report Required By The U.S. Congress Under §305(b) of the Clean Water Act," New Mexico Environment Department, Water Quality Control Commission, NMED/SWQ-00/1, http://www.nmenv.state.nm.us/swqb/305b_2000.html (accessed March 24, 2004)

b = All toxics for which USEPA has prepared a federal Clean Water Act § 304(a) guidance document were reviewed as required by USEPA.

c = Pollutants present in concentrations or combinations such that designated or attainable uses are not supported.

d = This reach includes areas wholly or in-part on Tribal Lands which are removed and separate from State of New Mexico jurisdictional authority.

e = Fully supported; impacts observed.

f = NMED/SWQB has no physical data to support "stream bottom deposits" listings. {SWQB is in the process of developing stream bottom deposit protocols for the expressed purpose of measuring the impacts of stream bottom deposits.}

g = A Total Maximum Daily Load for this pollutant has been approved by the WQCC on this stream reach.

As Tables 12.7-4 and 12.7-5 indicate, there are databases with information such as discharge permittees and storage tank permit holders. Additionally, there is a Superfund data base, which contains two entries in the subregion, one in each watershed, shown in Table 12.7-6.

Table 12.7-6 Superfund Information Systems - CERCLIS Database

JEMEZ WATER TANKS

Site Name:	Jemez Water Tanks
Street:	BOX 100
City / State / ZIP:	Jemez Pueblo, NM 87024
NPL Status:	Not on the NPL
Non-NPL Status:	SI Start Needed
EPA ID:	NMD986684017
EPA Region:	6
County:	Sandoval
Federal Facility Flag:	Not a Federal Facility

NACIMIENTO MINE/MILL

Site Name:	Nacimiento Mine/Mill
Street:	5.7MI.East Of Intersection With NM44
City / State / ZIP:	Cuba, NM 87013
NPL Status:	Not on the NPL
Non-NPL Status:	ESI Ongoing
EPA ID:	NMD981600471
EPA Region:	6
County:	Sandoval
Federal Facility Flag:	Not a Federal Facility
	Mines/Tailings

The wealth of information continues. Ground-Water Quality Data by Area can be found at <www.nmenv.state.nm.us/gwb/GWQ%20Atlas/data.html>. EPA has a list of systems in the Safe Drinking Water Information System (SDWIS). These include details on (a) Community Water Systems (Water Systems that serve the same people year-round (e.g. in homes or businesses)), (b) Non-Transient Non-Community Water Systems (Water Systems that serve the same people, but not year-round (e.g. schools that have their own water system)), and (c) Transient Non-Community Water Systems (Water Systems that do not consistently serve the same people (e.g. rest stops, campgrounds, gas stations)).

Not a great deal of water quality information is available below the upstream boundary of the Jemez Pueblo. Jemez and Zia Pueblos are deeply engaged in watershed planning.³ See Section 8 for information on Navajo water planning.

12.7.4. Recommendations

Río Jemez is now poised to prepare water quality plans --such as §319 ones-- to address their TMDL issues. Still lacking is data for various reaches as to why a given stretch has the problems seen in the testing. While a Watershed Restoration Action Strategy (WRAS) has been prepared for the Río Puerco (see appendices), and projects are underway to address the issues, an update of the TMDLs is also needed in the Río Puerco. In both watersheds, better data and benchmarks would aid in understanding the relationship of watershed management with water quality. Data could also help with the creation of localized water budgets (supply, demand, future demand) which can, in turn, be analyzed in accord with watershed capabilities.

With an increase in septic tanks, additional monitoring may well be needed. Where non-point sources of pollution, such as suspended sediment from the upper watershed, exists, management plans are needed.

One inorganic constituent that occurs naturally in groundwater - arsenic- currently is subject to an MCL of 0.05 mg/L. In January 2006, this MCL will be reduced to 10 micrograms per liter (μ g/L) (0.010 mg/L), a level that is commonly exceeded in regional groundwater under natural conditions. If water quality in the subregions does not meet new federal standards for arsenic, action will have to be taken, so plans need to be prepared. Additional testing may be required to fully evaluate the extent of arsenic within the planning region.

12.7. WATER QUALITY	
12.7.1. Introduction.	
12.7.2. General Information.	3
12.7.3. Issues Specific To The Subregional Planning Region	8
12.7.3.1. Río Jemez	
12.7.3.2. Río Puerco	18
12.7.4. Recommendations	29

³ Analytical Quality Associates, Inc. www.aqainc.net/pueblo_scope.html has prepared information for the Pueblo of Jemez, Department of Resource Protection, which included water quality analysis, as well as a soil assessment (watershed and agricultural) and preparing a vegetation monitoring program plan. Region 2's plan mentions that the Navajo Nation's

Clean Water Act 305(b) notes that major threats to water quality in the portions of the Navajo Reservation that are in the Rio Puerco Basin include livestock grazing and construction, especially of highways, roads, and bridges (EMI, 1997).
